 - Predictive Analytics result

Introduction

- Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

- Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions needs to be in place to ensure a successful landing program.

Section 1

METHODOLOGY

Methodology

Executive Summary

- Data collection methodology:
 - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
 - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - How to build, tune, evaluate classification models.

Data Collection

- * The data was collected using various methods
 - Data collection was done using get request to the SpaceX API.
 - Next, we decoded the response content as a Json using `.json()` function call and turn it into a pandas dataframe using `.json_normalize()`.
 - We then cleaned the data, checked for missing values and fill in missing values where necessary.
 - In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
 - The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

Data Collection – SpaceX API

- * We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.
- * The link to the notebook is https://github.com/Drkar eemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/data_collection_API.ipynb

Now let's start requesting rocket launch data from SpaceX API with the following URL:

```
✓ [7] spacex_url="https://api.spacexdata.com/v4/launches/past"
```

```
✓ [8] response = requests.get(spacex_url)
```

Check the content of the response

```
✓ [9] print(response.content)
```

```
b'[{ "fairings": { "reused": false, "recovery_attempt": false, "recovered": false, "ships": [] }, "links": { "patch": { "small": "http
```

You should see the response contains massive information about SpaceX launches. Next, let's try to discover some more relevant information for this project.

▼ Task 1: Request and parse the SpaceX launch data using the GET request

To make the requested JSON results more consistent, we will use the following static response object for this project:

```
✓ [10] static_json_url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DS0321EN-SkillsNetwork/datas
```

We should see that the request was successful with the 200 status response code

```
✓ [11] response.status_code
```

```
200
```

Now we decode the response content as a Json using `.json()` and turn it into a Pandas dataframe using `.json_normalize()`

```
✓ [12] # Use json_normalize method to convert the json result into a dataframe  
data = pd.json_normalize(response.json())
```

Data Collection - Scraping

- * We applied web scrapping to webscrap Falcon 9 launch records with BeautifulSoup
- * We parsed the table and converted it into a pandas dataframe.
- * The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/Data_Collection_with_Web_Scraping.ipynb

```
First, let's perform an HTTP GET method to request the Falcon9 Launch HTML page, as an HTTP response.

# use requests.get() method with the provided static_url
# assign the response to a object
html_data = requests.get(static_url)
html_data.status_code

200

Create a BeautifulSoup object from the HTML response

[5] # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
soup = BeautifulSoup(html_data.text, 'html.parser')

Print the page title to verify if the BeautifulSoup object was created properly

[6] # Use soup.title attribute
soup.title

<title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>

TASK 2: Extract all column/variable names from the HTML table header
+ Code + Text

Next, we want to collect all relevant column names from the HTML table header

Let's try to find all tables on the wiki page first. If you need to refresh your memory about BeautifulSoup, please check the external reference link towards the end of this lab

[7] # Use the find_all function in the BeautifulSoup object, with element type 'table'
# Assign the result to a list called 'html_tables'
html_tables = soup.find_all('table')

Starting from the third table is our target table contains the actual launch records.

[8] # Let's print the third table and check its content
first_launch_table = html_tables[2]
print(first_launch_table)

<table>
  <tr>
    <td><a href="/wiki/NASA" title="NASA">NASA</a> <a href="/wiki/Commercial_Resupply_Services" title="Commercial Resupply Services">CRS</a>
    </td>
    <td class="table-success" style="background: #9EFF9E; vertical-align: middle; text-align: center;">Success
    </td>
    <td class="table-noAttempt" style="background: #EEEE; vertical-align: middle; white-space: nowrap; text-align: center;">No attempt
    </td></tr>
    <tr>
      <td colspan="9">Last launch of the original Falcon 9 v1.0 <a href="/wiki/Launch_vehicle" title="Launch vehicle">launch vehicle</a>, first use of the
      </td></tr>
    <tr>
      <th rowspan="2" scope="row" style="text-align:center;">6
    </th>
  </tr>
</table>
```

Data Wrangling

- * We performed exploratory data analysis and determined the training labels.
- * We calculated the number of launches at each site, and the number and occurrence of each orbits
- * We created landing outcome label from outcome column and exported the results to csv.
- * The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/Data_Wrangling.ipynb

EDA with Data Visualization

- * We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

- The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/EDA_with_Data_Visualization.ipynb

EDA with SQL

- * We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- * We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
 - The names of unique launch sites in the space mission.
 - The total payload mass carried by boosters launched by NASA (CRS)
 - The average payload mass carried by booster version F9 v1.1
 - The total number of successful and failure mission outcomes
 - The failed landing outcomes in drone ship, their booster version and launch site names.
- * The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/EDA_SQL.ipynb

Build an Interactive Map with Folium

- * We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- * We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- * Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- * We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

- * We built an interactive dashboard with Plotly dash
- * We plotted pie charts showing the total launches by a certain sites
- * We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- * The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/Interactive_Visual_Analytics_with_Folium.ipynb

Predictive Analysis (Classification)

- * We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- * We built different machine learning models and tune different hyperparameters using GridSearchCV.
- * We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- * We found the best performing classification model.
- * The link to the notebook is https://github.com/Drkareemkamal/SpaceX-Falcon9-DS-Capstone/blob/main/Machine_Learning_Prediction.ipynb

Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

Section 2

Plots drawn from EDA

Flight Number vs. Launch Site

- * From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

Payload vs. Launch Site

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

Success Rate vs. Orbit Type

- * From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

Flight Number vs. Orbit Type

The plot below shows the Flight Number vs. Orbit type. We

- The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

Payload vs. Orbit Type

- * We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

Launch Success Yearly Trend

- * From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

Section 3

EDA using SQL

All Launch Site Names

- * We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

```
df = %sql select distinct Launch_Site from SPACEXTBL;
launch_df = pd.DataFrame(df)
launch_df.rename(columns={0: 'Launch_Site'}, inplace=True)
launch_df
```

```
* sqlite:///my_data1.db
Done.
```

	Launch_Site
0	CCAFS LC-40
1	VAFB SLC-4E
2	KSC LC-39A
3	CCAFS SLC-40

Launch Site Names Begin with 'CCA'

```
%%sql
select * from SPACEXTBL
where Launch_Site like 'CCA%' limit 5 ;
```

* sqlite:///my_data1.db
Done.

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASS_KG	Orbit	Customer	Mission_Outcome	Landing_Outcome
06/04/2010	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0.0	LEO	SpaceX	Success	Failure (parachute)
12/08/2010	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0.0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
22/05/2012	7:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525.0	LEO (ISS)	NASA (COTS)	Success	No attempt
10/08/2012	0:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500.0	LEO (ISS)	NASA (CRS)	Success	No attempt
03/01/2013	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677.0	LEO (ISS)	NASA (CRS)	Success	No attempt

- * We used the query above to display 5 records where launch sites begin with `CCA`

Total Payload Mass

- * We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)
+ Code

[10] %%sql

select sum(PAYLOAD_MASS_KG_) from SPACEXTBL
where customer = 'NASA (CRS)'

* sqlite:///my_data1.db
Done.
sum(PAYLOAD_MASS_KG_)
45596.0
```

Average Payload Mass by F9 v1.1

- * We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

Display average payload mass carried by booster version F9 v1.1

%%sql

```
select avg(PAYLOAD_MASS__KG_) from SPACEXTBL
where Booster_Version = 'F9 v1.1'
```

* sqlite:///my_data1.db

Done.

avg(PAYLOAD_MASS__KG_)

2928.4

First Successful Ground Landing Date

- * We observed that the dates of the first successful landing outcome on ground pad was 1st August 2018

List the date when the first succesful landing outcome in ground pad was acheived.

Hint: Use min function

```
[29] %%sql
```

```
select min(Date) from SPACEXTBL  
where Landing_Outcome = 'Success (ground pad)';
```

```
* sqlite:///my_data1.db
```

```
Done.
```

```
min(Date)
```

```
01/08/2018
```

Successful Drone Ship Landing with Payload between 4000 and 6000

- * We used the **WHERE** clause to filter for boosters which have successfully landed on drone ship and applied the **AND** condition to determine successful landing with payload mass greater than 4000 but less than 6000

List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000

%%sql

```
select Booster_Version from SPACEXTBL
where LANDING_OUTCOME = 'Success (drone ship)' and PAYLOAD_MASS_KG_ >4000 and PAYLOAD_MASS_KG_ <6000
```

* sqlite:///my_data1.db

Done.

Booster_Version

F9 FT B1022

F9 FT B1026

F9 FT B1021.2

F9 FT B1031.2

Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

[31] %%sql

```
select count(Mission_Outcome) from SPACEXTBL
where MISSION_OUTCOME like 'Success%'
```

```
* sqlite:///my_data1.db
Done.
count(Mission_Outcome)
100
```

[33] %%sql

```
select count(Mission_Outcome) from SPACEXTBL
where MISSION_OUTCOME like 'Failure (in flight)%'
```

```
* sqlite:///my_data1.db
Done.
count(Mission_Outcome)
1
```

- * We used wildcard like '%' to filter for **WHERE** Mission_Outcome was a success or a failure.

Boosters Carried Maximum Payload

List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

%%sql

```
select Booster_Version, PAYLOAD_MASS_KG_ from SPACEXTBL
where PAYLOAD_MASS_KG_ = (SELECT max(PAYLOAD_MASS_KG_) FROM SPACEXTBL)
ORDER BY Booster_Version;
```

* sqlite:///my_data1.db

Done.

Booster_Version	PAYLOAD_MASS_KG_
F9 B5 B1048.4	15600.0
F9 B5 B1048.5	15600.0
F9 B5 B1049.4	15600.0
F9 B5 B1049.5	15600.0
F9 B5 B1049.7	15600.0
F9 B5 B1051.3	15600.0
F9 B5 B1051.4	15600.0
F9 B5 B1051.6	15600.0
F9 B5 B1056.4	15600.0
F9 B5 B1058.3	15600.0
F9 B5 B1060.2	15600.0
F9 B5 B1060.3	15600.0

- * We determined the booster that have carried the maximum payload using a subquery in the **WHERE** clause and the **MAX()** function.

2015 Launch Records

- * We used a combinations of the **WHERE** clause, **LIKE**, **AND**, and **BETWEEN** conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

```
%%sql

select date, Landing_Outcome,Booster_Version,Launch_Site from SPACEXTBL
where Landing_Outcome = 'Failure (drone ship)' and substr(Date,7,4)='2015'
```

```
* sqlite:///my_data1.db
Done.
```

Date	Landing_Outcome	Booster_Version	Launch_Site
01/10/2015	Failure (drone ship)	F9 v1.1 B1012	CCAFS LC-40
14/04/2015	Failure (drone ship)	F9 v1.1 B1015	CCAFS LC-40

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

[25] %%sql

```
select Landing_Outcome,count(Landing_Outcome) from SPACEXTBL
where Date between '04/06/2010' AND '20/03/2017'
GROUP BY LANDING_OUTCOME
ORDER BY COUNT(LANDING_OUTCOME) DESC
```

* sqlite:///my_data1.db

Done.

Landing_Outcome	count(Landing_Outcome)
Success	20
No attempt	9
Success (drone ship)	8
Success (ground pad)	7
Failure (drone ship)	3
Failure	3
Failure (parachute)	2
Controlled (ocean)	2
No attempt	1

- * We selected Landing outcomes and the **COUNT** of landing outcomes from the data and used the **WHERE** clause to filter for landing outcomes **BETWEEN** 2010-06-04 to 2010-03-20.
- * We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

A dramatic photograph of a SpaceX Falcon Heavy rocket launch. The rocket is ascending vertically, leaving a bright, glowing orange and yellow plume of fire and smoke. The background is a dark, deep blue sky. The rocket's three boosters are visible, with the central core and two side boosters all firing. The overall scene is one of immense power and technological achievement.

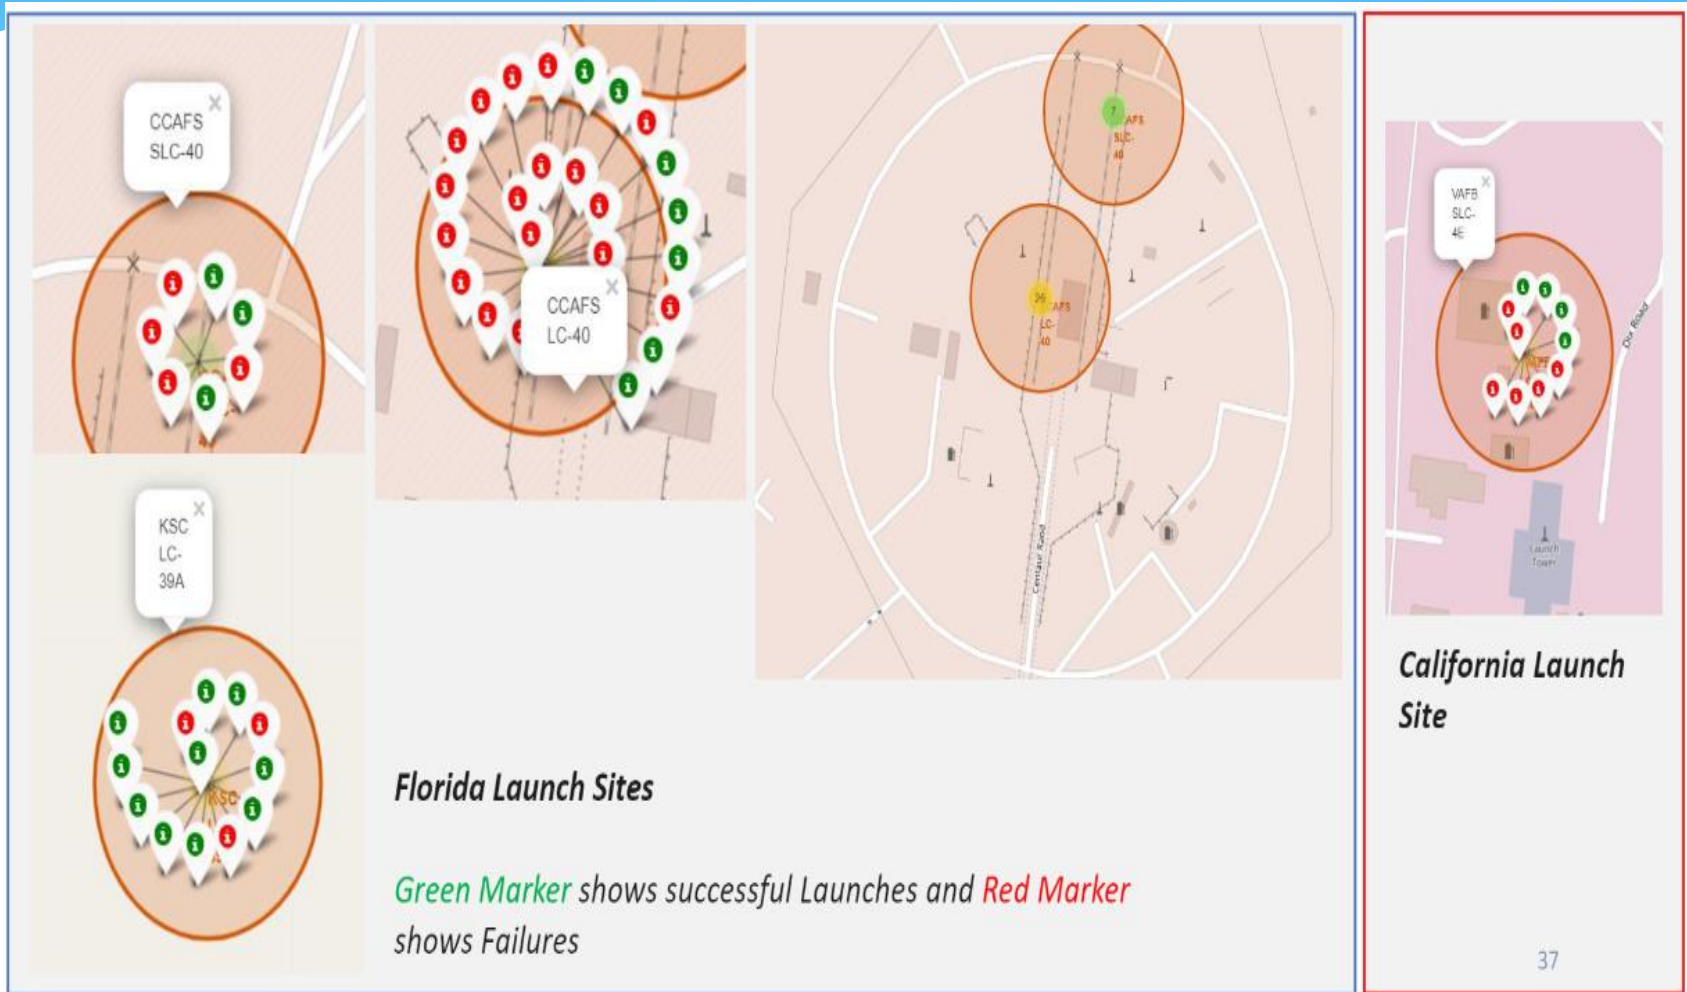

Section 4

Launch Site Analysis

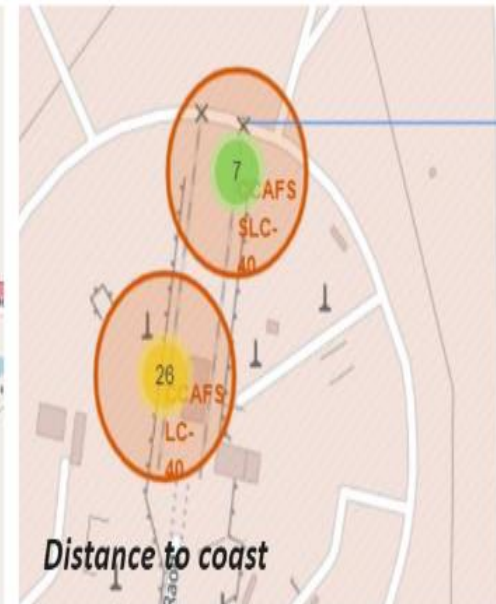

All launch sites global map markers

Markers showing launch sites with color labels

Launch Site distance to landmarks

- Are launch sites in close proximity to railways? No
- Are launch sites in close proximity to highways? No
- Are launch sites in close proximity to coastline? Yes
- Do launch sites keep certain distance away from cities? Yes

The background of the slide is a photograph of a SpaceX Falcon Heavy rocket launch. The rocket is ascending vertically, leaving a bright, glowing orange and yellow plume of fire and smoke. The sky is dark blue, and the overall scene is dynamic and powerful. The text is overlaid on the left side of the image.

Section 5

Plot a Dashboard using Plotly Dash

Pie chart showing the success percentage achieved by each launch site

Total Success Launches By all sites

We can see that KSC LC-39A had the most successful launches from all the sites

Pie chart showing the Launch site with the highest launch success ratio

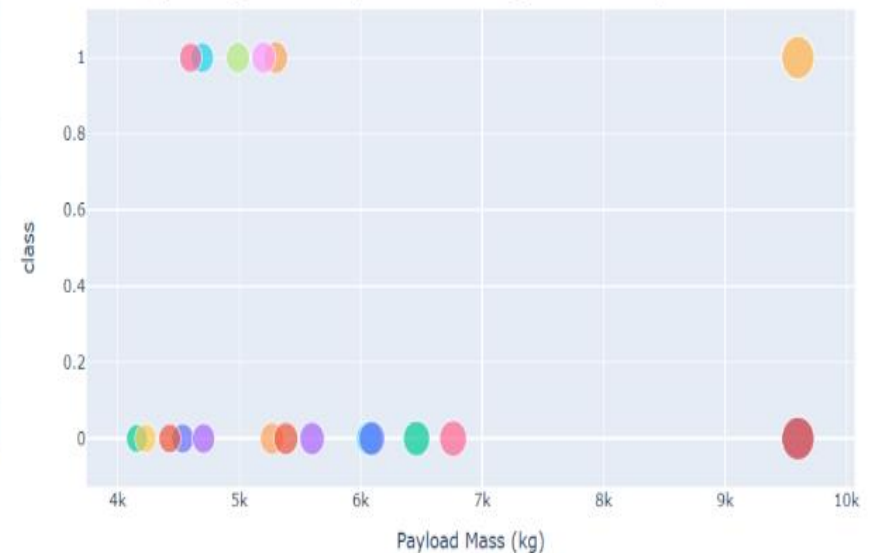

KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

Low Weighted Payload 0kg – 4000kg

Heavy Weighted Payload 4000kg – 10000kg

We can see the success rates for low weighted payloads is higher than the heavy weighted payloads

Section 6

Predictive Analysis (Classification)

Classification Accuracy

- * The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn_cv.best_score_,
          'DecisionTree':tree_cv.best_score_,
          'LogisticRegression':logreg_cv.best_score_,
          'SupportVector': svm_cv.best_score_}

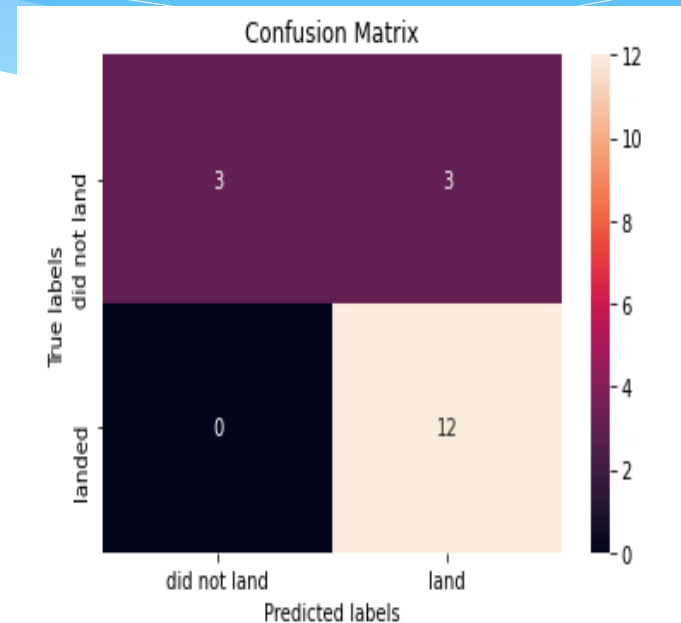

bestalgorithm = max(models, key=models.get)
print('Best model is', bestalgorithm, 'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree_cv.best_params_)
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn_cv.best_params_)
if bestalgorithm == 'LogisticRegression':
    print('Best params is :', logreg_cv.best_params_)
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm_cv.best_params_)
```

```
Best model is DecisionTree with a score of 0.8732142857142857
```

```
Best params is : {'criterion': 'entropy', 'max_depth': 8, 'max_features': 'auto', 'min_samples_leaf': 4, 'min_samples_split': 5, 'splitter': 'random'}
```

Confusion Matrix

- * The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

Conclusions

We can conclude that:

- * The larger the flight amount at a launch site, the greater the success rate at a launch site.
- * Launch success rate started to increase in 2013 till 2020.
- * Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- * KSC LC-39A had the most successful launches of any sites.
- * The Decision tree classifier is the best machine learning algorithm for this task.

Thank you
